React Hooks

Control the state and other React features...

What is a hook and when to use it?

A Hook is a special function that lets you “hook into” React features.

Basic hooks

useState

```
import React, { useState } from 'react';

function Example() {
  const [count, setCount] = useState(0);

  return (
    <div>
      <p>You clicked {count} times</p>
      <button onClick={() => setCount(count + 1)}>
        Click me
      </button>
    </div>
  );
}
```

useEffect

```
useEffect(() => {
  document.title = `You clicked ${count} times`;
}, [count]); // Only re-run the effect if count changes
```

THANKS!

Any questions?
